User Scenario:

Relocation Assistant

Bob, who lives in a small town, is a recent graduate who has just been hired for a new position. The only thing is: this position is in a completely different state that Bob has never been to before. Not only is he tasked with relocating to the new location, he has a fairly limited time to do so. With relocation to a new and distant area around the corner, Bob decides to use the new Relocation Assistant website that he has discovered that not only provides him with information on amenities in the new location, but also shows him possible housing options. As the day to move approaches, Bob uses the website to search for housing options in the new location, while also being provided information on things such as places he can shop, transportation options, and amenities within the new location, which are all separated and sorted based on user reviews that are generated by locals and travelers alike. Once the day to move has arrived, he already has his new home picked out. Once he arrived to the new location, he begins the process of finalizing his new home.
